IN THE CLAIMS:

1. (Currently amended) A computer tomograph,
 - having a gantry, which contains a rotor rotating in the operating state about an axis of rotation and from which data is transferred,
 - having at least one transmitter attached to the rotor for transmitting light in the direction of the axis of rotation; the light being modulated with the data,
 - having at least one receiver mounted on the axis of rotation for receiving the light transmitted through the free space by the transmitter.
2. (Original) A computer tomograph as claimed in claim 1, having at least two transmitters, which are attached to the rotor offset with respect to one another.
- 3: (Original) A computer tomograph as claimed in claim 1, having a transmitter that transmits the light in at least two different directions.
4. (Currently amended) A computer tomograph as claimed in claim 1, in which the spectrum of the transmitted light is divided into a plurality of regions and the light of at least two of the respective regions can be is modulated with different data.
5. (Original) A computer tomograph as claimed in claim 4, in which each transmitter transmits the light of one region.
6. (Original) A computer tomograph as claimed in claim 4, in which a transmitter transmits light from a plurality of regions.
7. (Original) A computer tomograph as claimed in claim 1, in which the receiver comprises optical means for deflecting and/or scattering the light beams.

8. (Original) A computer tomograph as claimed in claim 1, in which the transmitter transmits laser light.
9. (Original) A computer tomograph as claimed in claim 4, in which the receiver is able to receive a plurality of spectral regions of the transmitted light separately from one another.
10. (Original) A computer tomograph as claimed in claim 1 having a plurality of receivers, which are arranged in succession on the axis of rotation.
11. (Original) A computer tomograph as claimed in claim 1 having a pivotable gantry and means for holding the position of the receiver on the axis of rotation when performing the pivoting movement.
